## 1 Abstract

This should be a very brief explanation of your research paper (around 150 words). It normally includes information about the issue, why you are interested in that issue, your method/model, analysis results, discussions and conclusions.

This paper analyses the data gathered from surveying 625 undergraduate students. The authors of the survey tried to prove two hypothesis: 1) During students' junior years, they tend to primarily focus on getting good grades while during their senior years, the focus shifts towards a deep-understanding of the subject and 2) students' enjoyment and interest

tends to deteriorate as they progress through their studies. It is not obvious why this might be the case and if the student's sex or studied subject has any bearing. This is why the survey has 15 questions and probes 7 assessment categories. Each category consists of 3 to 1 questions and because the order of the questions is randomised, the student should not know the categories nor notice any patterns.

The data manipulation was done using R and tidywerse packages. A full analysis will be presented, including data: preparation, analysis, exploration and interpretation; calculation of confidence interval for a proportion, interpretation of the results using different kinds of graphs and an explanation of the methods used.

#### 2 Introduction

This section should explain the topic, why it is important, and how you approach the issue

It is interesting how undergraduate students' goals change through-out their studies. They often experince various syndroms like: burnout, impostour, disheartening or even attempt a suicide. A Harvard graduate, Alex Chang, in his TEDx talk titled "The Unspoken Reality Behind the Harvard Gates" speaks about the pressure of gettings the best grades; how he was called for a jasmine tea to his tutor and asked if he couldn't give it his all, while he already was doing the best he could. He also recalls one tragic night when he and his roommates were woke up at 4am, to be informed that one of his friend has taken his own life.

Becasue this paper is going to be talking about student's course enjoyment, expectations and his or her focus on grades vs. understanding I would like to give it another, less visible shade for there might be a lot more to say about a student who is at the bottom of the scale. A student who is not enjoying the course, finds it not interesting but still primarly aims to perform better than others and is lead by the fear of performing poorly. We will try to find such students and calculate the confidence-interval-for-a-proportion of finding a student-at-risk, and test the hypotheses.

#### 3 Data

Explain your dataset and how the was data is collected – e.g. your sampling strategy or information given by the project information.

#### 3.1 Initial Data

This is how the data looked like before cleaning:

| seq | year | age | sex | subject | q1 | q2 | q3 | q4 | q5 | q6 | q7 | q8 | q9 | q10 | q11 | q12 |
|-----|------|-----|-----|---------|----|----|----|----|----|----|----|----|----|-----|-----|-----|
| 6   | 3    | 19  | 1   | 1       | 7  | 2  | 2  | 6  | 7  | 6  | 7  | 7  | 5  | 5   | 7   | 5   |
| 7   | 3    | 20  | 2   | 1       | 7  | 2  | 1  | 7  | 7  | 6  | 4  | 4  | 1  | 6   | 5   | 2   |
| 8   | 3    | 21  | 1   | 1       | 1  | 1  | 5  | 4  | 7  | 6  | 1  | 2  | 3  | 3   | 7   | 1   |
| 9   | 3    | NA  | 2   | 1       | 4  | 2  | 3  | 3  | 5  | 4  | 3  | 7  | 2  | 2   | 7   | 2   |

| mastgrad | enjoy | interest |
|----------|-------|----------|
| 1        | 7     | 7        |
| 4        | 6     | 6        |
| 1        | 7     | 7        |
| 4        | 7     | 7        |

#### 3.2 Cleaning the Data

#### 3.2.1 Dropping

First, the *seq* column was dropped since it does not serve any purpose. Second, rows with empty cells were dropped because they could falsify the results.

#### **3.2.2** Coding

The following coding informations was applied to the data:

| Sex    | Code |
|--------|------|
| Male   | 1    |
| Female | 2    |

| Subject           | Code |
|-------------------|------|
| Management        | 1    |
| Law               | 2    |
| Tourism           | 3    |
| General Economics | 4    |
| Accounting        | 5    |
| Statistics        | 6    |

E.g., the code for Male was 1, so the cells in the sex column containing 1 were replaced with a Male string; the code for General Economics was 4, so the cells in the subject column containing 4 were replaced with a General Economics string. This is how the sex and subject columns looked like after applying the coding information:

| sex    | subject    |
|--------|------------|
| Male   | Management |
| Female | Management |
| Male   | Management |
| Female | Management |

#### 3.2.3 Derandomization/Renaming

The students were presented with the questions in a randomized order. Becasue the random order was known, it was assumed that the collected data was put into a table in the The random order was known and the questions were derandomised in the data set, i.e., question 6 from the Performance avoidance category is numbered 1 in the survey. In the data set results for question 1 were renamed to results for question 6 question 12 from the Mastery avoidance category is numbered 2 in the survey, etc. Table 1 presents this mapping.

Table 6: In the survey, questions from 1 to 12 were ordered randomly; questions 13, 14 and 15 remained in the same order.

| Survey order     | 6 | 12 | 11 | 1 | 7 | 2 | 10 | 8 | 5 | 3  | 9  | 4  | 13 | 14 | 15 |
|------------------|---|----|----|---|---|---|----|---|---|----|----|----|----|----|----|
| Category mapping | 1 | 2  | 3  | 4 | 5 | 6 | 7  | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 |

#### 3.3 Clean Data

This is how the date looked like after cleaning:

| year | age | sex    | subject    | q6 | q12 | q11 | q1 | q7 | q2 | q10 | q8 | q5 | q3 | <b>q</b> 9 | q4 |
|------|-----|--------|------------|----|-----|-----|----|----|----|-----|----|----|----|------------|----|
| 3    | 19  | Male   | Management | 7  | 2   | 2   | 6  | 7  | 6  | 7   | 7  | 5  | 5  | 7          | 5  |
| 3    | 20  | Female | Management | 7  | 2   | 1   | 7  | 7  | 6  | 4   | 4  | 1  | 6  | 5          | 2  |
| 3    | 21  | Male   | Management | 1  | 1   | 5   | 4  | 7  | 6  | 1   | 2  | 3  | 3  | 7          | 1  |
| 3    | 19  | Female | Management | 7  | 5   | 7   | 4  | 7  | 4  | 6   | 7  | 3  | 1  | 5          | 3  |

| interest | enjoy | mastgrad |
|----------|-------|----------|
| 7        | 7     | 1        |
| 6        | 6     | 4        |
| 7        | 7     | 1        |
| 6        | 6     | 1        |

## 4 Methodology

This section explains the statistical methods and/or your model. It is also a common practice to present the statistical model structure (i.e. equation) here as well.

tidyverse packages (ggplot2, dplyr, tibble, readr, tidyr, purrr);

Around 625 students were surveyed. They answered on a 7-level scale; 1 meaning the student feels the statement asked in the quesion is 'Not true of him/her' and 7 meaning the student feels it is 'Very true of him/her'. See the table below for a graphical explanation:

| Not true of me | 1 | 2 | 3 | 4 | 5 | 6 | 7 | Very true of me |
|----------------|---|---|---|---|---|---|---|-----------------|
|----------------|---|---|---|---|---|---|---|-----------------|

#### 4.1 Interpretation

Table 1 presents the category, its interpretation (Based on the category's questions) and the questions' numbers.

Table 10: Table Test

| Category                 | Interpretation  | Question   | # of Questions |
|--------------------------|---|------------|----------------|
| Performance approach     | Importance of doing better than others?                 | 1, 2, 3    | 3              |
| Performance<br>avoidance | Motivation based on<br>the fear of<br>performing poorly | 4, 5, 6    | 3              |
| Mastery approach         | Prevalence of mastery approach                          | 7, 8, 9    | 3              |
| Mastery avoidance        | Student's fear of not mastering the course              | 10, 11, 12 | 3              |
| Interest                 | Student expects the course to be interesting            | 13         | 1              |
| Enjoyment                | Student expects the course to be enjoyable              | 14         | 1              |
| Importance focus         | Student's importance focus on understanding vs. grades  | 15         | 1              |

Because Interest, Enjoyment and Importance focus categories consisted only of 1 question, no further computation was required to interpret the data from these categories. For the remaining categories, which number of questions was equal to 3, a mean for each assessment category was computed, and saved for each individual student. This resulted in 4 extra columns added to the original data set. An example of these can be seen below:

| m1       | m2       | m3       | m4       |
|----------|----------|----------|----------|
| 4.666667 | 4.333333 | 6.000000 | 3.333333 |
| 2.333333 | 2.333333 | 5.000000 | 2.000000 |
| 3.666667 | 1.333333 | 5.666667 | 1.333333 |
| 3.666667 | 3.666667 | 6.000000 | 5.333333 |
| 3.333333 | 3.333333 | 7.000000 | 4.000000 |

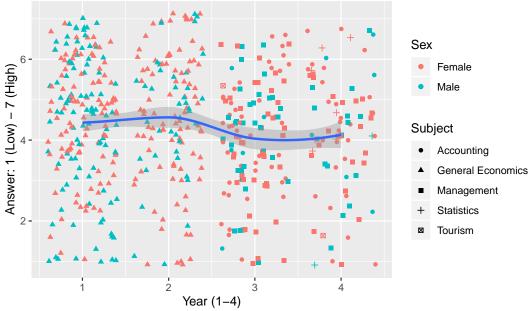

#### 4.1.1 4 Assessment Categories

For the sake of data exploration, the means from the 4 assessment categories: Performance approach, Performance avoidance, Mastery approach and Mastery avoidance were plotted

on basis of sex and subject.

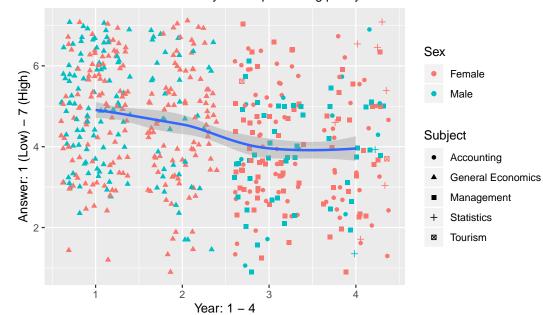

Student's grade-orientation focus set on basis of: different years of study, sexes and subjects.

How important it is to students to do better than others?

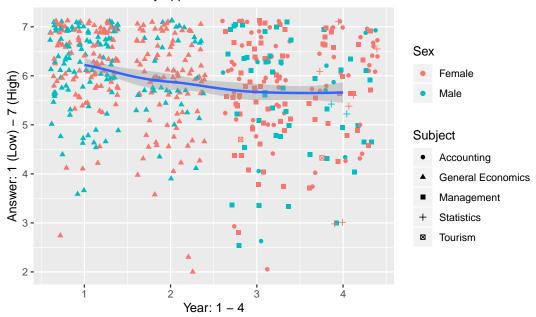

Student's grade-orientation focus set on basis of: different years of study, sexes and subjects.

How motivated are students by fear of performing poorly?

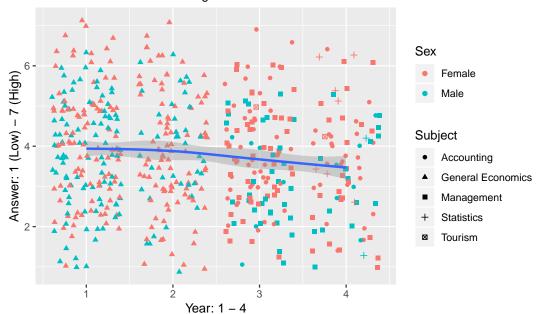

Student's focus on understanding set on basis of: different years of study, sexes and subjects.

Prevalence of mastery approach.

Student's focus on understanding set on basis of: different years of study, sexes and subjects.

Student's fear of not mastering the course.

#### 4.2 Confidence Interval for a Proportion

#### 4.2.1 Equations

$$\hat{p} = \frac{x}{n} = \frac{events}{trials}$$

$$Z = 1.96$$

$$\hat{p} \pm Z \sqrt{\frac{\hat{p}(1-\hat{p})}{n}}$$

#### 4.2.2 Calculations

Calculating a 95% confidence interval for the student-at-risk population proportion.

$$\hat{p} = \frac{2}{625} = 0.0032$$

$$\hat{p} \pm Z = 0.0032 \pm 1.96 \sqrt{\frac{0.0032(1 - 0.0032)}{625}} = 0.0032 \pm 0.0044$$

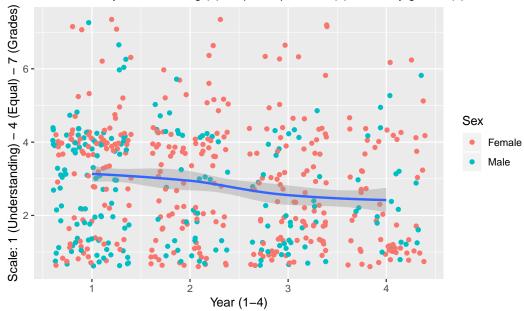

## 5 Results

Present both your informal and formal analyses. We are going to test the hypothesis 1) and 2) on basis of sex and subject and we are going to find out if, and how many students are at risk of developing mental health issues.

#### 5.1 Mastery Approach

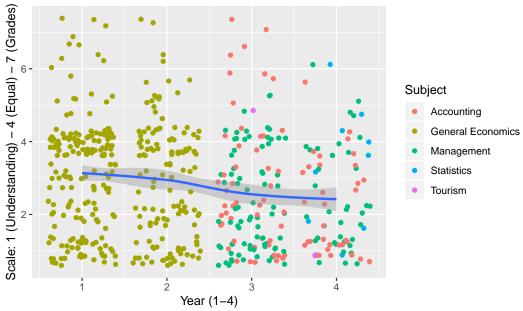

Student's importance scale between understanding and grades set on basis different years of study, sexes and subjects.

Student's importance scale between understanding and grades set on basis different years of study, sexes and subjects.

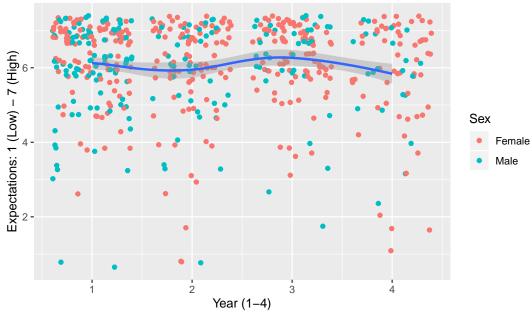

Scale: Primarly understanding (1) / Equal Importance (4) / Primarly grades (7)

## 5.2 Enjoyment

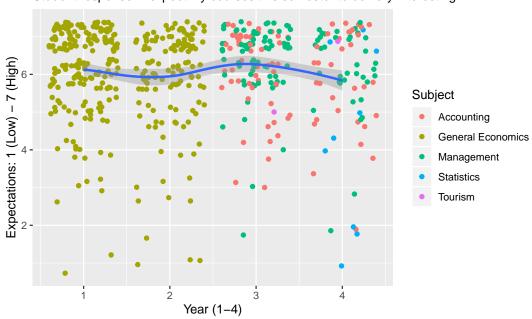

Student's course interestedness expectations set on basis of: different years of study, sexes and subjects.

Student response: 'I expect my courses this semester to be very interesting'

Student's course interestedness expectations set on basis of: different years of study, sexes and subjects.

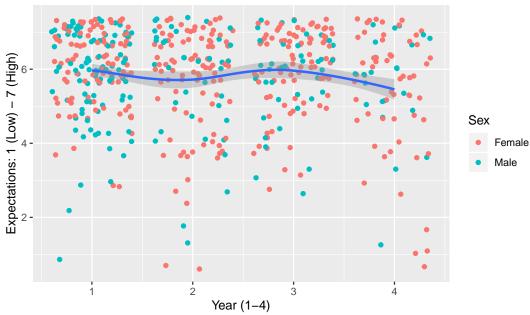

Student response: 'I expect my courses this semester to be very interesting'

#### 5.3 Interest

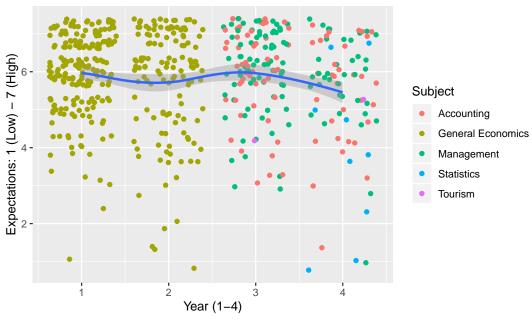

Student's course interestedness expectations set on basis of: different years of study, sexes and subjects.

Student response: 'I expect my courses this semester to be very interesting'

Student's course enjoyment expectations set on basis of: different years of study, sexes and subjects.

Student response: 'I expect my courses this semester to be very enjoyable'

#### 5.4 Confidence Interval for a Proportion Interpretation

| age | sex    | subject           | enjoy | interest | mastgrad | m1 | m2 |
|-----|--------|-------------------|-------|----------|----------|----|----|
| 18  | Female | General Economics | 1     | 1        | 7        | 6  | 7  |
| 18  | Female | General Economics | 1     | 1        | 4        | 7  | 7  |

The upper confidence interval for a proportion is 0.0076279, and the lower is -0.0012279, which gives us a confidence interval, for proportion of finding a student-at-risk as: CI = (0.00762, -0.00122). This mean we could say with 95% confidence the percentage of the times we should expect to find a student at risk is between 0.7% and 0%.

## 6 Conclusion / Discussion

You need to conclude your project, discuss the results, discuss any reservations that you have about the study and list any future work.

The hypothese turned out to be true/false?

This might not seems like a lot but we have the actual data to back it up. We know that there are 2 students who might be at risk of developing mental health problems: they are both female, aged 18 years old and study general economics at their sophmore year. Wheter this data should be used directly to try to find these students is a different debate. What could be definietly done is try to announce this fact that there have been found students who might be at risk and that there is help available. Most universities offer counceling for students but the problem is to have already troubled and lonely students reach out for help. Maybe a university could develop their own programmes for sutdents which they can use to self-diagnose and if the system would detect that they might be experiencing mental health problems they could direct them towards a councelor at their university. Such tests already exists but the reason why I think they should be university specific is for the fact that it makes the student feels that their university cares about their mental health and they do not need to feel ashamed to ask for help becasue it was their home institution who has made the first step.

Univerity should be the one reaching out, not the other way around.

so, what conclusions do you have bruh? Could analyse AGE
